

ACT Influenza Surveillance Report – No. 9, 2018

Summary: Influenza notifications continue to be reported to ACT Health in low numbers, indicating that the 2018 influenza season has not yet commenced.

Influenza notifications

Reporting Period: 1 January to 2 September 2018, Weeks 1-35

Between 1 January and 2 September 2018, there were 267 notifications of influenza reported to ACT Health, of which only 32 occurred in the last fortnight (Figure). In comparison, there were 1,821 notifications of influenza reported to ACT Health during the same time period in 2017. The low numbers of influenza notifications in recent weeks indicates that the 2018 influenza season has not yet commenced.

Year to date, 70% of notifications (n=187) were influenza A and 30% of notifications (n=79) were influenza B. There was 1 notification of a case co-infected with influenza A and B. Of the 68 influenza A notifications with subtype information available, 49 (72%) were H1N1 and 19 (28%) were H3 (presumed H3N2).

Overall, notifications have been highest among adults aged 30-39 years (18%, n=48), followed by children aged 0-4 years (13%, n=33) and adults aged 50-59 years (12%, n=32).

Figure. Number of influenza notifications, by week and year of onset, 1 January 2013 to 2 September 2018, ACT.

**Data provided for the current and most recent weeks may be incomplete. All data are preliminary and subject to change as updates are received. Notification data include all cases diagnosed in the ACT in residents of the ACT. Generally, notified cases represent only a small proportion of cases of influenza occurring in the community.*

Notification data were exported on 3 September 2018 for the period 1 January 2013 to 2 September 2018, by onset date.
